SUMMARY

Software engineer who builds backend systems and works across the full stack. Led an 11-engineer team to ship an AI product in under a month, and owned service-to-service communication across four services on a food commerce platform. Builds payment flows with verified webhooks, wallets, and ledgers, mostly in Python with Django and FastAPI, and moves into Next.js and React when a project needs it.

SKILLS

Languages: Python, TypeScript, JavaScript, SQL, Bash
Frameworks: Django, Django REST Framework, Django Ninja, FastAPI, Flask, Node/Express (TypeScript), Next.js, React, Vue (basic)
Databases: PostgreSQL, Redis, MongoDB, MySQL
Infrastructure and DevOps: Docker, AWS (EC2), GitHub Actions (CI/CD), Nginx, Gunicorn, Celery, Linux, Git
Backend concepts: REST APIs, microservices, webhooks, SSE, JWT, OAuth, API keys, RBAC, Paystack

EXPERIENCE

Anvila (HNG) | Full-Stack Engineer, Team Lead Apr – Jun 2026
AI-agent manifest generator: describe an agent, answer follow-up questions, preview the generated files, and publish to GitHub.

- Led an 11-engineer team (4 backend, 7 frontend) and shipped Anvila in under a month. Wrote the technical requirements document and delegated work across both teams.
- Owned database design and migrations across the team, and decided where to use SSE versus regular requests.
- Owned the prompt-to-manifest generation pipeline and its event-publishing API layer. 30+ manifests generated in production use.
- Built publishing to GitHub (public org repos or a user's private account), skill caching in the GitHub org, and token tracking per chat and in total.
- Frontend: designed the Next.js cookie-based auth, with server wrappers that attach auth to backend calls and refresh tokens automatically. Used Next as a proxy between frontend and backend, built client-side streaming, and chose the libraries and styling.
- Fixed a chat bug the rest of the team couldn't: conversations stayed untitled in the UI after the first message.

Taskingdom | Backend Developer (Contract, Remote) Jul 2025 – Jan 2026
Task-based gaming platform with real-money rewards.

- Built a webhook integration linking third-party game outcomes to internal accounts, triggering automatic reward payouts.
- Designed abuse-prevention logic with a hybrid Redis-TTL and join-table strategy, preventing reward farming across task resets.
- Built a role and permission system for four user types: regular, VIP, business, and influencer.
- Moved heavy operations to Celery workers backed by Redis, improving response times on user-facing endpoints.

Sitelytics (HNG) | Backend Engineer Oct – Dec 2025
Website vulnerability scanner that explains findings in plain English and offers to connect users with someone to fix them.

- Built the admin system solo: RBAC, user monitoring, scan tracking, and admin-managed content.
- Built authentication: login, tokens, and Google OAuth.
- Built the platform-wide notification system (in-app and email) and standardized notification handling across the team.
- Worked with the team on the SSE streaming endpoints and the async scanning flow, which used background workers.

Meerge Africa | Backend Engineer (Contract, Remote) Dec 2024 – Jul 2025
Multi-service food commerce platform. Worked across four services: Supplier, Delivery, Customer, Kitchen.

- Designed and led the Supplier service from scratch; supported 500+ suppliers with about 50 products each during the pilot.
- Owned REST service-to-service communication across all four services, using JWT tokens scoped to specific service identities.

- Designed the Delivery service database: assignments, status transitions, and a rider availability system where riders choose their days (with a minimum) and time windows, and assignment happens only inside them. Added rider location with Google Geocoding.
- Designed the Kitchen service database: customized food and menu items, allergies, dietary information, and food goals.
- Acted as backend lead for 8 weeks, coordinating 7 engineers after the engineering lead left.
- Wrote Dockerfiles, fixed CI pipelines, and debugged deployment failures with the DevOps team.
- Refactored error handling into structured, logged flows with consistent response formats, cutting silent failures.
- Pilot handled about 500 orders from about 500 users.

Freelance Software Engineer 2023 – Present

- Built an e-commerce store for a cake and juice business and a concert ticketing page. Both take Paystack payments, with webhook verification on the backend.
- Built the backend for Locked In (Python/Django, 2025): authentication, user management, and goal setting and tracking.
- Built a portfolio site for an artist and a brand website (Next.js, React, WordPress).

Oshodi-Isolo Cooperative Multipurpose Society | Variation Officer (Full-time) Jul 2023 – Apr 2024

- Handled member accounts, loan processing, and transaction records in a role where accuracy mattered.

PROJECTS

Settle (FastAPI, PostgreSQL, Redis, Next.js): Payment collection for Nigerian SMEs on Nomba's Virtual Account and Transfers APIs, built for the Nomba x DevCareer hackathon. Each business gets dedicated bank details and payment links, with idempotent webhook-driven reconciliation, an append-only ledger, and live payment status over SSE. Built solo, backend and frontend, in under a week.

Wallet Service (Django, Django Ninja, PostgreSQL): Wallet backend with Paystack deposits, internal transfers, idempotent webhooks, and atomic multi-write transfers. Google OAuth with JWT for users and scoped API keys for external services.

Insighta Labs (Python): Demographic-intelligence API with dual OAuth (browser cookie flow and CLI via PKCE), short-lived JWTs with single-use hashed refresh tokens, and a rule-based natural-language query parser.

Flint (FastAPI, PostgreSQL, Redis, Next.js): Background job scheduler built from scratch, with a priority heap with aging, a DAG dependency engine with cascade retry, and a dead-letter queue.

Galleria (FastAPI, MongoDB, Celery, Next.js): Event photo platform with face recognition (RetinaFace, ArcFace) and cosine-similarity search across thousands of embeddings in under 100ms.

EDUCATION

Higher National Diploma, Statistics | Yaba College of Technology, Lagos Jul 2024 – Jan 2026

National Diploma, Statistics | Yaba College of Technology, Lagos Sep 2021 – Jan 2023

ALX Software Engineering Program Graduate
